

Some doctors admit to a laying on of hands

By HUGH WYATT

At least 25% of gynecologists and 13% of general practitioners admitted to kissing, fondling or having sexual intercourse with patients, a study by doctors at New York's Lenox Hill Hospital and the University of California at Los Angeles has disclosed.

But 19% of the physicians insisted that they saw nothing wrong with

"erotic contact," the study said, adding that in fact another 19% of the physicians "actually felt this (erotic contact) was useful to patients."

The study, based on interviews with 420 physicians, was conducted by Drs. Don Sloan, director of the Human Sexuality Clinic at Lenox Hill Hospital, and Sheldon H. Kardener and Ivan N. Mensh of UCLA.

"Keep in mind that this (the study) has nothing to do with ethics," Sloan said in an interview. "This was a scientific inquiry, and unrelated to

the current controversy dealing with patient-physician involvement."

Quoting findings of parts of the study by the UCLA physicians, Sloan explained that psychiatry placed third when five medical specialties were ranked by frequency of "erotic contact."

"Well ahead of them were gynecologists, who had the most erotic contact with patients, and, unexpectedly, general practitioners, who placed a very close second," according to the study, which is reported in the Ladies' Home Journal.
